

SYSTEM DESCRIPTION

Production and Test Manifolds are used for gathering production from several wells to a centralized manifold where the wells may individually be placed on test and/or production. They can be used for converging multiple junctions into a single channel or diverging a single channel into multiple junctions. Manifolds are may be manually operated or automatically operated by valves with automatic timers.

Production and Test Manifolds can be designed for ANSI and API ratings for various design pressures and various pipe sizes. Chokes can be included for pressure reduction, which may be fixed or adjustable as well as manual or automated. Other instrumentation and controls can be provided as per customer specifications.
